Mean 10.987; Variance 4.759; scale 2.308 Statistics: Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Novel chemokines, e.g. thymus expressed chemokine - used for treating inflammatory conditions including asthma.

Claim 5; Rage 92-94; 202pp; English.

The present sequence encodes a human dendritic cell chemokine receptor. Antibodies which bind to the protein can be used in detecting or diagnosing various immunological conditions related to expression of the protein. The nucleic acid can be used for screening and isolating DNA clones for the chemokines, especially from other species. The chemokine can be used in the treatment of conditions associated with abnormal physiology or development, including
                                                                                                                                                                                                                                             /*tag= b

Stample 3; Page 54-56; 100pp; English.

Example 3; Page 54-56; 100pp; English.

Two primers (066148, 066149) were used to amplify human genomic DNA purified from leukocytes. Approximately 1000 clones were isolated after the intial amplification reation and probed with sequences of the intial amplification reaction and probed with sequences of specific for seven transmembrane receptors ILBR1, AT2R and R20.

Clones which did not hybridise were then chosen for sequence analysis. Three new clones were then chosen for sequence of encode seven transmembrane receptor segments. Two more primers (Q66151, 066152), were used to isolate a full length version of one of these clones designated V31 (See Q66153). This is the sequence of exon 3 of the V31 genomic clone (along with partial intron sequences) and is the final exon of the clone. The TAG stop codon is found at costione 1900 BP; 431 A; 594 C; 458 G; 417 T;

The coding for Epstein Barr Virus induced (EBI) polypeptide(s)

The coding for Epstein Barr Virus induced (EBI) polypeptide(s)

The darkibodies to EBII. 2 and 3 - useful for detecting EBV by and antibodies to EBII.

Thybridisation or by immunoassay

Claim 2; Page 52-54; 84pp; Emglish.

EBV infected B lymphocytes recapitulate features of antigen stimulation in enlarging, increasing RNA synthesis, expressing activation antigens and adhesion molecules, secreting Ig and proliferating. Unlike antigen stimulated B lymphocytes, EBV infected B lymphocytes continue to proliferate (in vitro) as infected B lympholastoid cell lines. Because of the similar effects of EBV and antigen, EBV induced genes are likely to include mediators of antigen induced B lymphocyte growth or differentiation.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                DNA encoding seven trans:membrane receptors - used to develop prods, for use as therapeutic or diagnostic agents for conditions involving the receptors.

Example 2; Page 44-46; 100pp; English.

Example 2; Page 44-46; 100pp; English.

Two primers (Q66148, Q66149) were used to amplify human genomic DNA purified from leukocytes. Approximately 1000 clones were isolated after the intial amplification reation and probed with sequences specific for seven transmembrane receptors ILBR1, AT2R and R20.

Clones which did not hybridise were then chosen for sequence analysis. Three new clones were then chosen for sequence canalysis. Three new clones were then chosen for sequence canalysis. Three new clones were then they more primers (Q66151, Q66152), were used to isolate a full length version of one of these clones (this sequence) which was designated v31.

Example 3: Page 49-51; 100pp; English.

A human cDNA encoding the seven transmembrane receptor V31 was isolated by first amplifying a partial cDNA clone from a human tonsil cDNA library using two primers (066154, Q66155). The resulting amplified products were probed using two radioactively labelled sequences (Q66156, Q66157). A hybridising band was isolated from the gel and cloned. The resulting clone was named pV31-5' end (Q66158). A full length cDNA clone was isolated from a peripheral blood mononuclear cell library using V31 specific primers (Q66159, Q66152). Clone PMMC75 was isolated and the V31 cDNA insert in the clone was
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         tteeteetgaeeetteeettetgggeetaeagegeggeeaa--gtee-tgggtetteggt 438

Claim 6; Page 15; 19pp; Japanese.

This sequence encodes human MIP-1 alpha/RANTES receptor (macrophage inflammatory protein 1 alpha/regulated on activation, normal T cell expressed and secreted). The human MIP-1 alpha/RANTES receptor protein may be used in a method for the screening of human MIP-1 alpha/RANTES receptor protein used to raffinity compounds. The MIP-1 alpha/RANTES receptor coding sequence may be included in an expression vector, preferably pCCR, and used to transform a CHO cell for use in the same method. The receptor protein can provide a preventive and treating agent for viral diseases, infectious diseases, tumours, allergy, diabetes, central diseases, hyperlipidaemia, hypercloaemia, osteoporosis, digestive ulcers,

The sequence is that of the C-C chemokine receptor gene which was isolated by PCR from PMA treated HiGO cells using PCR primers whose sequence was designed to correspond to conserved sequences in two transmembrane regions of known cytokine receptors. The sequence can be used in therapeutic or diagnostic compsns. for inflammation and other cytokine mediated disorders.

The 1-alpha and RANTES receptor nucleic acid - used to develop

The 1-alpha and RANTES receptor nucleic acid - used to develop

The products for the detection of these cytokine(s) and their receptors,

The products for the detection of these cytokine(s) and their receptors.

This nucleic acid sequence encodes a claimed receptor for macrophage inflammatory protein 1 alpha (MRP-1 alpha) and regulated upon activation normal T expressed and secreted (RANTES) protein. Also claimed are: (1) a subsequence of the nucleic acid, having at least colaimed are: (1) a subsequence of the nucleic acid, having at least colaimed are: (1) a subsequence of the nucleic acid, having at least colaimed are: (1) a subsequence of the nucleic acid, having at least to contiguous nucleotides; (2) a cell transformed or transfected with the nucleic acid; and (3) purified MIP-1 alpha/RANTES receptor

Dolypeptide. The products can be used for detecting the MIP-1

The la/RANTES is useful for monitoring the levels of these cytokines in a patient. Such measurements are useful in following the anti-

Inflammatory effects of drugs and prospective usefulness of new anti-

prods. for use as therapeutic or diagnostic agents for conditions involving the receptors.

Example 5; Page 58-60; 100pp; English.

Two primers (Q66148, Q66149) were used to amplify human genomic DNA purified from leukocytes. Approximately 1000 clones were isolated of after the initial amplification reation and probed with sequences specific for seven transmembrane receptors ILBRI, AT2R and R20.

Clones which did not hybridise were then chosen for sequence analysis. Three new clones were identified that appeared to encode seven transmembrane receptor segments. Two more primers (Q66151, Q66152) were used to isolate a full length version of one of the human V31 clone (See Q66153). A fragment of the human clone was used to isolate this V31 genomic clone of the mouse from a library.

"T weeful for treating inflammatory disorders, for detecting
neutrophil(s) and for isolating IL-8 receptor from liq.mixt.

"T neutrophil(s) and for isolating IL-8 receptor from liq.mixt.

"I claim 2: Fig 1A-B; 74pp; English.

Monoclonal antibodies were raised against recombinant interleukin-8

(IL-8) receptor subtypes A and B from both human and rabbit sources

(R09950-53 encoded by 09949-52). The A subtype receptor (IL-8rB) is a

a high affinity receptor and the B subtype receptor (IL-8rB) is a

low affinity receptor. The monoclonal antibody (mAb) pref. binds to

the IL-8 binding domain thus blocking its activation. The mAbs are

useful for treating inflammatory disorders (see key words) and for

detecting the presence of neutrophils in a biological sample. The

mAbs are also useful in the isolation of IL-8 receptors from a mixture.

Recombinant mammalian interleukin-8 receptor - used for screening interleukin-8 binding antagonists, used to treat inflammation bisclosure; Figl : 71pp; English.

Rabbit high affinity IL-8 receptor gene was isolated from rabbit produce a rabbit neutrophils and used as a source of poly(A)+ RNA, to produce a rabbit neutrophil cDNA library. 250,000 recombinant plaques were screened for those which hybridized to an antisense coligonucleotide (Q30015). This probe was designed based on the sequence derived from the second transmedrane domain of G-protein-coupled receptors. After tertilary screening, six plaques were isolated. The insert of one of these plaques, termed F3R was of 2.5 kb in size. This insert was sequenced. The protein deduced from the F3R clone demonstrates that it belongs to the family of G-protein-coupled receptors. The deduced protein sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human CCKR3 chemokine receptor coding sequence.                                                                                                                                                            New Isolated chemokine CCF8 and chemokine receptor CCKR3 - used to develop products useful for the diagnosis and treatment of conditions associated with abnormal physiology or development Claim 15; Page 60-62; 73pp; English.

This is the nucleotide sequence encoding a novel CCKR3 chemokine receptor isolated from a Th0-activated human T-cell cDNA library using the sequence amplified by primers T79097 and T79098 as a probe. The encoded protein can be used to screen for (art)agonists that bind are useful in the treatment of conditions associated with abnormal physiology or development.

Claim 1; Page 114-115; 153pp; English.
A consensus DNA sequence (T31336) codes for a novel human receptor (W03378), designated Eos L2 or C-C chemokine receptor 2 (CKR-3).
It was deduced by comparing a genomic clone (T31334) and a cDNA clone (T31335) coding for CKR-3 proteins (W03376 and W03377) having slightly different sequences. Initial sequence information revealed
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                190 TITATAAGAAGGCCAGGTCTATGACAGACGTCTTATCTTGAACATGGCCATTGCAGAC

2 regions in which the cDNA sequence appeared to be shifted in frame, resulting in 2 sets of 4 contiguous amino acid differences in the predicted proteins. Further sequence analysis revealed only a single difference between the 2 open reading frames, the genomic clone coding for threonine at position 276 and the CDNA clone for serine.
                                                                                                                                                                                                                                                                                                            Gaps

Claim 1; Page 111-113; 153pp; English.
A genomic DNA clone (731335) codes for a novel receptor (W03377), designated Eos L2 or C-C chemokine receptor 3 (CKR-3), involved in leukocyte migration associated with inflammation. It was isolated from a human library constructed from eosinophils obtd. from a patient with hyper-eosinophils syndrome using a probe (P4 cDNA) encoding the MIP-lalpha/RANTES receptor. A CKR-3 genomic clone (T31334) was also isolated, and a consensus sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        195 aaatacaggaggeteegaattatgaecaacatetaeetgeteaaeetggeeattteggae

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ŏ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            g
library is a subtracted library derived from the UI-R-CO library, which is a subtracted library derived from the UI-R-AI and UI-R-AI libraries. The UI-R-AI library consisted of a mixture of individually tagged normalized libraries constructed from rat placenta, adult lung, brain, liver, kidney, heart, spleen, ovary, and muscle. The UI-R-EI library consisted of a mixture of individually tagged normalized libraries constructed from 8, 12 and 18-Ady embryo. The tag is a string of 3-5 nucleotides present between the Not I site and the oligo-dr track which allows identification of the library of origin of a clone within the mixture. The subtracted library (UI-R-CI) was constructed as follows: PCR amplified cDNA inserts from UI-R-CO clones from which 3' ESTS had been derived was used as a driver in a hybridization with the UI-R-CO library in the form of single-stranded circles. The remaining single-stranded circles (subtracted library) was purchased.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     VALUES 312 bp MRNA EST 06-FEB-1998

Site_2: EcoRI; The library used for sequenching was a
sublibrary derived from a human retina cDNA library.
Inserts from retina cDNA library DNA were isolated,
randomly primed, PCR amplified, size-selected, and cloned
into lambda gt10. Individual plaques were arrayed and
used as templates for PCR amplification, and these PCR
products were used for sequencing."

/note="Organism="Soled; Vector: pT7T3D-Pac (Pharmacia) with a modified polylinker; Site_1: Not I; Site_2: Eco RI; Equal amounts of plasmid DNA from three normalized libraries (fetal lung NDHL19W, testis NHT, and B-cell NCI_CGAP_GCB1) were mixed, and ss circles were made in vitro. Following HAP purification, this DNA was used as tracer in a subtractive hybridization reaction. The driver was PCR-amplified cDNAs from pools of 5,000 clones made from the same 3 libraries. The pools consisted of I.M.A.G.E. clones 227480-302087, 682632-687239, 726408-72811, and 722096-731399. Subtraction by Bento Soares and M. Fatima Bonaldo."
